Genetic Counseling Services For Your Patients

Telehealth consults

- One-on-one with patient
- With patient + family members
- With patient +/- family members and healthcare providers
- In English, French, Spanish

Grey Genetics can help with any of the 6 key components of providing genetics services to your patients

Genetics and Guidelines Education

The starting point is knowing what you're looking for and why.

Understanding basic genetics principles at the disease level is the place to start. Knowing what major societal guidelines say about who, why, when and how to test is also important. Grey Genetics can help get your practice up to speed and keep you abreast of the latest guideline updates.

Systems for Patient Identification

Genetics has to fit into your practice routines.

Knowing guidelines is not enough. Systems and checklists are essential for ensuring that you are capturing relevant information to identify patients who meet guidelines for testing. Grey Genetics can help you build on your existing systems and practice routines to integrate genetics and provide consistent care.

Pre-Test Counseling

Patients want to know why you are offering them testing.

Patients need to understand the risks, benefits, and limitations of any genetic testing offered. There are two-minute versions and two-hour versions of pre-test conversations. This can be handled completely within a physician's office or referred out. Hybrid systems work too! Grey Genetics can customize a plan that best fits your practice.

Post-Test Counseling

Patients need to understand the implications of their results.

Patients need an understanding of what their results mean for their own medical management. They also need to understand the implications for family members. Depending on case specifics, a post-test conversation may be brief and simple or quite involved. Grey Genetics can help with every case or just the more complicated ones.

Integrating Genetics Results Into Personalized Plan of Care

The value of genetic testing lies in how results inform care.

Results of genetic testing should impact medical management, even if only to affirm a standard plan of care. Particularly when results are positive, referrals to relevant specialists are often needed. Grey Genetics can help you build out your referral network.

Sharing Your Successes

Tracking patient outcomes inspires and instructs.

Although not essential for care of your individual patients, tracking which patients you have tested, what their results have been, and how genetic testing has impacted their medical management and their family members can not only be valuable for publications but also encouraging to your staff and inspiring to your colleagues. This is Personalized Medicine.
